DECLARATION

I hereby declare that the IET Project report entitled “**QR-BASED FOOD ORDERING SYSTEM**” submitted in partial fulfilment of the requirements for the award of degree of **Bachelor of Science in Computer Science with Cognitive System** is an original work and it has not been previously formed the basis for the award of any Degree, Diploma, Associate ship, Fellowship or similar titles to any other university or body during the period of my study.

Place: Coimbatore

Date:

Signature of the Candidate

HARI NITHIN S

ACKNOWLEDGEMENT

I am ineffably indebted to **Dr. K. Sundararaman, M.Com., M.Phil., Ph.D., CEO**, Sri Krishna Institutions, Sri Krishna Arts and Science College, Coimbatore.

I convey my profound gratitude to **Dr. R. Jagajeevan MBA., Ph.D., Principal**, Sri Krishna Arts and Science College for giving me this opportunity to undergo this Capstone Project work.

It is my prime to solemnly express my sense of gratitude to **Dr. K. S. Jeen Marseline, M.C.A., M.Phil., Ph.D., Head and Dean**, Department of IT & Cognitive Systems, Sri Krishna Arts and Science College.

I would like to extend my thanks and unbound sense for the timely help and assistance given by **Mrs. DEEPA B** Department of IT & Cognitive Systems, Sri Krishna Arts and Science College in completing the Capstone Project work. Her remarkable guidance at every stage of my work was coupled with suggestion and motivation.

I take this opportunity to thank my parents and friends for their constant support and encouragement throughout this training.

HARI NITHIN S

CHAPTER 1

INTRODUCTION

1.1 ORGANIZATION PROFILE

Rezilyens

Rezilyens is a global premium MSSP trusted by enterprises to safeguard their most critical digital assets. With advanced detection engineering, elite SOC teams, and AI-driven contextual security, we deliver clarity, precision, and resilience in cyber defence.

Our mission is to empower organisations to operate fearlessly with an intelligence-led, automation-driven security foundation backed by world-class experts.

Rezilyens' teams hold globally recognised certifications including SOC2, ISO27001, PCI DSS, CISSP, OSCP, CISM, and advanced cloud security credentials for AWS, Azure, and GCP.

Through real-time behaviour analytics, proprietary threat intelligence, and deep contextual insights, Rezilyens provides superior visibility and faster decision-making across multi-cloud and hybrid environments.

Organisations also gain direct access to Rezilyens' internal DFIR specialists — no outsourcing, ensuring rapid forensic investigations and precise incident containment

1.2 Background

Earlier, customers had to call a waiter to place an order. The waiter wrote the order on paper, informed the kitchen, and prepared the bill manually. This process caused several problems such as:

- Wrong or missing orders.
- Delay in service during busy hours.
- Errors in billing.
- Customers could not know the status of their orders.
- Management could not track daily sales or waiter performance.

With QR code technology, customers can now scan a QR code, view the digital menu, and place orders directly from their phones. This makes ordering easier and faster.

1.3 Problem Definition

The old system had the following problems:

- Orders were written manually, which caused mistakes.
- Customers could not check their order status.
- Bills were prepared manually, leading to errors.
- Management could not track waiter performance.
- Tables were not properly assigned to waiters.
- Updating the menu required printing new menu cards.
- Customers had to wait for a waiter to place an order during busy times.

1.4 Proposed Solution

The proposed system is a QR Code-Based Food Ordering and Billing System. It is a web application that allows customers to order food, track their orders, and complete billing digitally.

Features for Customers

- Scan a QR code to open the menu.
- Enter name and mobile number to start ordering.
- Browse food by category or search for items.
- Add items to the cart and place orders.
- Track order status (Placed → Preparing → Ready → Served → Paid).
- Call a waiter when needed.
- View the bill and complete payment.

Features for Waiters

- Log in to the waiter portal.
- Receive customer orders instantly.
- Accept and update order status.
- Add extra items if required.
- Mark bills as paid.
- View daily orders and revenue.

Features for Admin

- Secure login with two-factor authentication.
- Manage menu items and categories.
- Add, edit, and assign tables to waiters.
- Generate QR codes for tables.
- Manage waiter accounts.
- Search, merge, and print bills.
- View order history and daily revenue reports.
- Monitor active tables and pending orders in real time.

1.5 Objectives and Scope

Objectives

- To create a QR code-based food ordering system that removes manual order taking.
- To let customers track their order status in real time.
- To provide waiters with a simple dashboard to manage customer orders.
- To give the admin full control over menus, tables, waiters, and billing.
- To improve admin security using two-factor authentication (TOTP).
- To generate bills automatically and manage bill numbers each day.
- To track waiter performance based on orders handled and revenue generated.
- To deploy the system online using Vercel and Supabase for easy access and reliability.

Scope

In Scope

- QR code menu for customers.
- Customer login using mobile number.
- Food ordering, cart, and order tracking.
- Waiter dashboard for managing orders and billing.
- Admin dashboard for managing menu, tables, waiters, and bills.
- Real-time order updates.
- Automatic deletion of old records after 2 days.
- Daily bill number generation.
- QR code generation for each table.
- Online deployment using Vercel and Supabase.

Out of Scope

- Mobile apps for Android or iOS.
- Online payment integration (payments are updated manually by staff).
- Support for multiple restaurant branches.
- Customer reward or loyalty programs.
- Separate kitchen display system (KDS).

CHAPTER 2

SYSTEM STUDY

2.1 Existing Systems

The restaurant technology market has seen the emergence of several digital ordering solutions over the past decade. A review of existing systems provides insights into the current state of the art and identifies gaps that the proposed system aims to address.

2.1.1 Zomato Order / Swiggy Dine-in

Platforms like Zomato and Swiggy have introduced dine-in ordering features that allow customers to browse menus and place orders via their respective mobile apps. However, these platforms require app installation, impose commission fees on restaurants (typically 15-30% per order), and do not offer real-time kitchen-to-table order tracking. The restaurant also loses control over the customer relationship and data.

2.1.2 Traditional POS Systems

Point-of-Sale systems like POSist, Petpooja, and Torqus provide comprehensive restaurant management but are primarily designed for waiter-operated workflows. They do not empower customers to place orders independently and require expensive hardware installations. Real-time customer-facing tracking is typically absent.

2.2 Technologies Used

Technology	Category	Purpose
React 19	Frontend Framework	Building the interactive user interfaces for all three roles
TypeScript	Programming Language	Type-safe development for both frontend and backend
Vite 8	Build Tool	Fast development server and optimized production builds for the frontend
Tailwind CSS 4	CSS Framework	Utility-first CSS framework for rapid, responsive UI styling
Node.js	Runtime Environment	Server-side JavaScript execution for the backend API
Prisma ORM 7	Database ORM	Type-safe database access layer with migration and schema management
PostgreSQL	Database	Relational database for persistent data storage (hosted on Supabase)
Supabase	Backend as a Service	Cloud-hosted PostgreSQL with connection pooling (PgBouncer)
QRCode.js	QR Generation	Generating unique QR codes for each restaurant table
React Native + Expo	Mobile Framework	WebView-based Android

CHAPTER 3

SYSTEM DESIGN

3.1 System Architecture

The QR-Based Food Ordering System follows a three-tier client-server architecture, comprising a Presentation Layer (React Frontend), a Business Logic Layer (Express.js Backend), and a Data Layer (PostgreSQL Database). The architecture is designed for deployment as a monorepo on Vercel, where the frontend is served as static assets and the backend runs as serverless functions.

Architecture Layers:

- **Presentation Layer:** React 19 with TypeScript, Vite 8, Tailwind CSS 4, React Router DOM 6. Serves three distinct interfaces — Customer PWA, Waiter Dashboard, and Admin Dashboard. Uses Server-Sent Events for real-time updates.
- **Business Logic Layer:** Node.js with Express.js 4, handling RESTful API endpoints organized into modular controllers (auth, menu, tables, orders, bills, sessions, waiters, events). Includes middleware for authentication, CORS, and cookie parsing.
- **Data Access Layer:** Prisma ORM 7 with PostgreSQL adapter (PrismaPg) connected to Supabase-hosted PostgreSQL. Uses connection pooling via pg.Pool with SSL, max 10 connections, and automatic cleanup on process exit.

3.2 Data Flow Diagrams

3.2.1 Level-0 DFD

This Context Diagram shows the high-level data flow between the central **QR Food Ordering System** and its three main users:

- **Customer:** Scans the QR code to browse the menu, place orders, and make payments while receiving live order updates and receipts.
- **Waiter:** Manages table statuses and receives real-time notifications for new customer orders and completed payments.
- **Admin:** Updates menu items, manages user access, and retrieves business analytics and sales reports.
- **The System:** Acts as the central hub, instantly routing all information between the customers, staff, and management.

3.2.2 Level-1 DFD

The Level-1 DFD decomposes the system into six major sub-processes:

- **Purpose:** A centralized, real-time system handling restaurant orders, menus, and payments.
- **Access:** Customers, Waiters, and Admins enter through a central User Auth (1.0) process, which validates them and manages their sessions.
- **The Hub:** Order Processing (3.0) is the brain of the system. It takes user inputs, pulls catalog data from Menu Management (2.0), and routes everything accordingly.
- **Transactions:** Completed orders are sent to Billing & Payment (4.0) to finalize transactions and generate receipts.
- **Live Updates:** A Real-Time SSE (5.0) module continuously runs in the background, instantly broadcasting order changes and payment confirmations back to the users' screens without them needing to refresh.
- **Storage:** Data is cleanly separated into five dedicated databases: Waiter (DS1), Session (DS2), Menu (DS3), Order (DS4), and Bill (DS5).

3.3 ER Diagram

The database consists of 11 tables (entities) designed in a normalized relational schema using Prisma ORM. The following table provides an overview of each entity and its purpose:

Entity	Description	Key Relationships
Branch	Restaurant branch information (name, address, phone, GST)	Has many Tables
Table	Physical dining table with QR code and slug identifier	Belongs to Branch; Has many Orders; Optionally assigned to Waiter

MenuCategory	Categories like Breakfast, Lunch, Dinner, Starters, Snacks, Gravy	Has many MenuItem
MenuItem	Individual food items with name, description, price, image, tags	Belongs to MenuCategory; Referenced by OrderItems
Order	Customer order linked to a table with status tracking	Belongs to Table; Has many OrderItems; May have one Bill
OrderItem	Individual line item in an order with quantity, price, special instructions	Belongs to Order; References MenuItem
Bill	Financial bill with subtotal, tax, discount, total, payment info	Belongs to Order; Optionally in BillGroup
BillGroup	Groups multiple bills for merged billing scenarios	Has many Bills
MergedBill	Tracks parent-child bill merge relationships	References parent and child Bill IDs
BillMergeHistory	Audit log for bill merge operations	Records merge details and reason
Waiter	Staff member account with username, email, password, and status	Assigned to Tables
CustomerSession	Customer phone-based session with table binding and expiry	Indexed by tableId

CHAPTER 4

MODULE AND DESCRIPTION

4.2.1 ADMIN LOGIN

Module Description

The Admin Login module provides secure access to the system management dashboard. It allows administrators to manage menu settings, table configurations, bill settlements, and waiter accounts while preventing unauthorized access.

Functional Requirements & Workflow

- The administrator enters the configured admin username.
- After username validation, the system initiates Two-Factor Authentication (2FA).
- A secure 6-digit OTP is generated and logged in the server console.
- The administrator enters the OTP for verification.
- The system validates the OTP against the active authentication window.
- Upon successful verification, a secure JWT session is created.
- The administrator is redirected to the dashboard.

Implementation Details:

Frontend Component

- LoginPage – Manages username validation and OTP verification screens.

Backend API / Controller

- login – Validates the admin username and initiates OTP verification.
- verifyOtp – Verifies the OTP and creates a secure session.

Database Models

- Admin credentials are managed through environment variables.
- Staff verification is performed using the Waiter model in schema.prisma.

4.2.2 USER REGISTRATION

Module Description

The User Registration module allows customers to access the food ordering system using their mobile number. It provides a simple registration process by associating the customer's phone number with a specific dining table.

Functional Requirements & Workflow

- Customers scan the QR code placed on their dining table.
- The system redirects them to the table-specific menu page.
- If no active session exists, customers are prompted to enter their 10-digit mobile number.
- The entered mobile number is validated by the system.
- The mobile number is linked to the selected table.
- A customer session is created and stored for future access.
- After successful registration, customers can browse the menu and place orders.

Implementation Details

Frontend Component

- MenuPage – Handles mobile number collection and session initialization.

Backend API / Controller

- createSession – Validates customer information and creates a customer session.

Database Models

- CustomerSession in schema.prisma stores customer mobile numbers, table information, and session expiry details.

4.2.3 USER LOGIN

Module Description

The User Login module manages customer session verification and restoration. It allows returning customers to continue using the system without repeating the login process.

Functional Requirements & Workflow:

- The system checks local storage for an existing customer session.
- Session details are verified with the backend using customer and table information.
- Valid sessions are automatically restored.
- Session expiry is extended by 24 hours upon successful verification.
- Customers can sign out manually, which clears session data and stored information.

Implementation Details

Frontend Component

- MenuPage Session Restoration Hook – Handles session retrieval and validation.

Backend API / Controller

- verifySession – Verifies active sessions and updates expiry timestamps.

Database Models

- CustomerSession in schema.prisma manages customer session records.

4.2.4 ITEM DETAILS

Module Description

The Item Details module displays menu items and provides customers with complete product information, availability status, category schedules, and cart management options.

Functional Requirements & Workflow

- Displays item name, description, price, and image.
- Applies category-based time restrictions for ordering.
- Marks unavailable items as "OUT OF STOCK".
- Displays dietary labels such as Veg and Non-Veg.
- Shows promotional badges like "BESTSELLER" and "SPICY".
- Allows customers to increase or decrease item quantities directly from the menu.

Implementation Details

Frontend Components

- MenuItemCard – Displays item information, badges, and quantity controls.
- CategoryTabs – Organizes menu items by category.
- SmartSuggestions – Recommends related food items.

Backend API / Controller

- getMenu – Retrieves categorized menu items and related information.

Database Models

- MenuItem and MenuCategory in schema.prisma store menu and category details.

4.2.5 ORDER DETAILS

Module Description

The Order Details module manages order processing, kitchen coordination, status tracking, billing, and customer updates throughout the order lifecycle.

Functional Requirements & Workflow

- Creates a new order when customers place an order.
- Merges new items with existing active orders to prevent duplication.
- Provides real-time order status updates using Server-Sent Events (SSE).
- Notifies customers when ordered items become unavailable and suggests alternatives.
- Requests customer confirmation when the order is ready for service.
- Displays bill details including subtotal, taxes, and final payable amount.
- Redirects customers to the payment process when billing is requested

Tracks order progress through the following stages:

- PLACED
- ACCEPTED
- PREPARING
- READY
- SERVED
- PENDING
- PAID

CHAPTER 5

TESTING

5.1 Testing Strategy

The testing strategy for the QR-Based Food Ordering System employs a combination of manual functional testing, integration testing, and user acceptance testing (UAT) conducted in the actual restaurant environment at Hotel Kavitha. Testing was performed across multiple devices (Android smartphones, iPhones, desktop browsers) and network conditions to ensure real-world reliability.

5.2 Test Cases

5.2.1 Customer Module Test Cases

Test ID	Test Case	Expected Result	Status
TC-01	Scan QR code on table to open menu	Menu page loads with correct table ID	Pass
TC-02	Enter valid mobile number (10 digits)	Session created; menu displayed	Pass
TC-03	Enter invalid mobile number (less than 7 digits)	Validation error shown	Pass
TC-04	Browse menu categories via tabs	Items filtered by selected category	Pass

TC-05	Search for a dish by name	Matching items displayed with result count	Pass
TC-06	Add item to cart	Cart count incremented; item appears in cart sheet	Pass
TC-07	Add special instructions to cart item	Instructions saved and sent with order	Pass
TC-08	Place order with items in cart	Order created; status shown as "Placed"	Pass
TC-09	Track order status in real-time	Status updates received via SSE within 1 second	Pass
TC-10	Checkout and view generated bill	Bill displayed with itemized breakdown and totals	Pass
TC-11	Submit UPI payment with transaction reference	Payment status set to AWAITING_CONFIRMATION	Pass
TC-12	Request Cash payment	Cash request notification sent to dashboard	Pass
TC-13	Call waiter to table	Waiter call alert shown on waiter dashboard	Pass
TC-14	Place second order (same session)	Items merged into existing order	Pass
TC-15	Order item from time-restricted category outside hours	Error message with available hours	Pass

5.2.2 Waiter Module Test Cases

Test ID	Test Case	Expected Result	Status
TC-16	Login with valid waiter username	Dashboard loaded; orders displayed	Pass
TC-17	Login with invalid username	Error: "Invalid waiter username"	Pass
TC-18	Login with disabled account	Error: "Account temporarily disabled"	Pass
TC-19	Accept an order (change status to PREPARING)	Order card updated; customer notified via SSE	Pass
TC-20	Mark order as READY	Customer sees "Ready to Serve" status	Pass
TC-21	Mark order as SERVED	Bill auto-generated; status changes to PENDING	Pass
TC-22	Add custom item to active order	Item added; order total recalculated	Pass
TC-23	Delete item from active order	Item removed; totals updated	Pass
TC-24	Replace unavailable item with substitute	Original removed, substitute added	Pass
TC-25	Generate bill for assigned table	Bill generated with correct totals	Pass
TC-26	Mark bill as paid	Order status changes to PAID	Pass

5.2.3 Admin Module Test Cases

Test ID	Test Case	Expected Result	Status
TC-27	Login with admin username	OTP prompt displayed	Pass
TC-28	Submit valid TOTP code	Admin dashboard loaded	Pass
TC-29	Submit invalid TOTP code	Error: "Invalid or expired code"	Pass
TC-30	Create new menu item	Item appears in menu; available to customers	Pass
TC-31	Update menu item price	New price reflected for customers	Pass
TC-32	Toggle item availability	Unavailable items hidden from customer menu	Pass
TC-33	Delete menu item	Item removed from database	Pass
TC-34	Create new table	Table created with QR code	Pass
TC-35	Generate QR code for table	QR code image displayed with scannable URL	Pass
TC-36	Create waiter account	Waiter can login with new credentials	Pass
TC-37	Disable waiter account	Waiter cannot login; existing session blocked	Pass

TC-38	Merge two bills	Bills combined; totals recalculated correctly	Pass
TC-39	Apply discount to bill	Total recalculated with discount applied	Pass
TC-40	Cleanup records older than 2 days	Old orders and bills deleted	Pass

CHAPTER 6

CONCLUSION AND FUTURE ENHANCEMENTS

6.1 Conclusion

The QR-Based Food Ordering System for Hotel Kavitha has been successfully designed, developed, and deployed as a production-grade, full-stack web application. The system effectively addresses the challenges of traditional restaurant ordering by providing a contactless, digital ordering experience that benefits all stakeholders — customers, waiters, and restaurant administrators.

Key achievements of this project include:

- Successfully implemented a complete food ordering lifecycle from QR scan to payment processing, deployed and operational at Hotel Kavitha, Coimbatore.
- Developed a real-time system using Server-Sent Events that provides instant order status updates across all connected clients, reducing communication delays and improving service speed.
- Implemented intelligent server-side order merging that automatically consolidates multiple orders from the same customer into a single order and bill, simplifying the billing process.
- Achieved zero-cost deployment using Vercel and Supabase free tiers, making the system economically viable for small and medium restaurants.
- Secured the admin dashboard with OTP-based two-factor authentication, compatible with Google Authenticator and other standard authenticator apps.

The system demonstrates the practical application of modern web technologies (React, Node.js, Prisma, PostgreSQL, TypeScript) in solving real-world business problems. It serves as a comprehensive example of full-stack development covering frontend design, backend API development, database management, real-time communication, authentication, and cloud deployment.

6.2 Future Enhancements

While the current system provides a complete and functional solution, several enhancements can be implemented in future iterations to further improve the system:

- **Kitchen Display System (KDS):** A dedicated screen interface for the kitchen showing incoming orders with preparation timers, reducing reliance on printed order tickets.
- **Advanced Analytics Dashboard:** Detailed business intelligence with graphical reports on revenue trends, popular items by time of day, waiter performance metrics, customer visit frequency, and table turnover rates.
- **Online Ordering for Takeaway/Delivery:** Extending the system to support takeaway and delivery orders, with estimated preparation time and delivery tracking.
- **Payment Gateway Integration:** Integrating with Razorpay or Cashfree for direct UPI and card payment processing within the application, eliminating manual payment verification.
